

The Best Hearing Requires a Lens

Join us for an Earlens Day on
Tuesday, July 26th or August 9th

Call us at 303-832-2054
and schedule your consultation
with sound demonstration!

Tiny Lens. Huge Difference

Earlens delivers a signal directly to the middle ear by vibrating the tympanic membrane via a lens placed in contact with the umbo, to provide an extension of audible bandwidth.

Bunny Barber, M.S., CCC-A
Audiologist and Owner of Denver Audiology

Amplifies sound across the
broadest bandwidth available —
2.5X than most hearing aids

No feedback (whistling) from
the product

32% Better speech understanding
in noise

Works with Apple Bluetooth
devices

The Best Hearing Requires a Lens

Only Earlens uses a tiny lens placed directly on your eardrum. The ear tip transmits high fidelity audio signals directly to the lens, gently vibrating your eardrum across the full frequency range. The result? Rich, natural sound.
